

Informática para Ciências e Engenharias

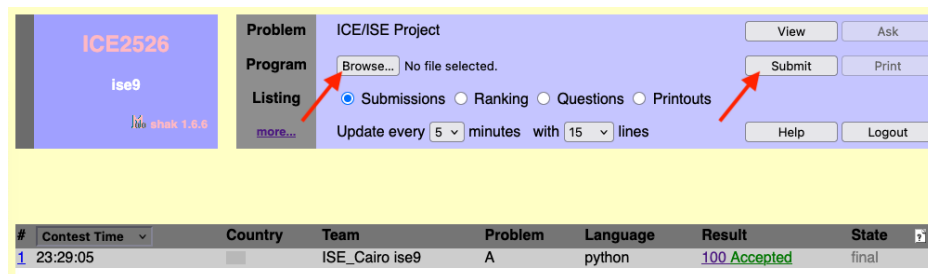

Final Project Submission — 2025/2026

23:59 May 30th

1 Project Submission

This work must be done in groups of a maximum of two students. It must be submitted by the end of the day on **May 30th** (midnight) at the URL <http://mooshak-public.di.fct.unl.pt/>. The mooshak system will only be available later, on a date to be announced. When available, follow the instructions below:

- Before submitting your solution to mooshak, you must run the program on your computer and verify the result for the provided examples. You should also do additional testing. Use the provided “`test_proj.py`”.
- At mooshak, choose the language (english, portuguese, etc...) before login.
- Select the “contest” ICE2526 and login with the user/password given by your instructor.
- Ensure that, at the beginning of your program (the .py file) there is a comment with the numbers and names of the group members.
- Submit the .py file with your program. For this, start by selecting your file with ”Choose File”. After that, ”Submit” (see fig.)

You can submit new versions as you work on your program, and only the last version will be evaluated by the professors.

The points obtained on the **mooshak** site is only an indicator of the tests passed correctly and not the final grade for the work. The tests performed by mooshak only test some functionalities, and the final evaluation will include tests that will not be made available.

Possible results the mooshak may give for your program:

- Accepted - your program passed the tests at mooshak.
- Compile Time Error - there is an error in your code that prevents the program from running.
- Runtime Error - at least one test failed and your program aborted with error.
- Time Limit Exceeded - your program took too much time and was aborted by the mooshak.
- Memory Limit Exceeded - your program used too much memory and was aborted by the mooshak.

- Wrong Answer - your program produced wrong results. That can be wrong values, bad output format, printed messages that were not asked, etc. Check the assignment.
- Presentation Error - too many or too few spaces or newlines.

2 Examples

Running your program and giving the following commands, should produce the following output:

test 1:

```
cmd> initdb
cmd> analyze Al.txt
cmd> report Al.txt
Results for file Al.txt:
peak element count
1.489 Aluminium 139060.0
```

test 3 — after test 2:

```
cmd> stats Na
2 results with Sodium
max count 1653.7
min count 1613.0
cmd> analyze Al.txt
cmd> stats Al
2 results with Aluminium
max count 139060.0
min count 7033.1
```

test 2:

```
cmd> initdb
cmd> analyze unknown1.txt
cmd> report unknown1.txt
Results for file unknown1.txt:
peak element count
0.521 Oxygen 5510.6
1.031 Sodium 1613.0
1.051 Sodium 1653.7
1.491 Aluminium 7033.1
1.741 Silicon 20102.0
3.311 Potassium 3747.5
```

test 4:

```
cmd> chart unknown1.txt
```
